Poncet’s Disease: A dis-jointed TB presentation

Savio Nguyen MD (PGY2) MD; Dr. Mehul Jariwala MD, DNB; Melissa Smith RN; Dr. Mahli Brindamour MD, FRCPC

Challenging Cases: Beyond the Basics
Feb 25, 2023
Clinical Presentation

- 14-year-old male admitted to tertiary care centre following new dx of type 2 diabetes.
- While inpatient, noted to have 3-week hx of polyarthralgia (bilateral knees/clavicles/small joints of hands and feet) limiting mobilization, refractory to NSAIDs and acetaminophen.
- Some weight loss, fatigue (assumed secondary to DM).
- No respiratory symptoms or features suggestive of extra pulmonary TB.
Patient Profile

- **PMHx**
  - fairly unremarkable other than new dx of T2DM, obesity, OSA.

- **Medications:**
  - Humalog, Lantus, Metformin, Vitamin D, NSAIDs, acetaminophen, cyclobenzaprine

- **TB Risk Factors:**
  - No documented TB contacts, no previous TB treatment/prophylaxis
  - No travel
  - Patient lives in community with current TB outbreak (~ 50% cases are pediatric)
Investigations

- **CBC:** N WBC, mild normocytic anemia, thrombocytosis
- **Inflammatory markers:** CRP 67.9 mg/L; ESR 79 mm/h
- **Infectious work-up:** TB IGRA positive. Chlamydia/gonorrhea PCR, viral hepatitis, HIV negative.
- **Auto-antibodies:** negative. HLAB27 negative.
- **CXR:** unremarkable
- **MRI:** N bone marrow signal, **mild non specific bilateral trochanteric bursitis, subacromial-subdeltoid bursitis, no other inflammatory synovitis** or CRMO
Outcome

- **Diagnosis:** Poncet’s Disease (Possible)
- **Treatment:** 6 months active TB therapy with RIPE DOT
- **Resolution:**
  - 1 month post tx: amelioration of arthralgia, no residual functional impairment
  - 4 months post tx: normalization of inflammatory markers
  - **Current update:** symptoms entirely resolved, tx completed with > 90% compliance.

## Appendix: Sharma et. al. PD Diagnostic Criteria

| Essential Criteria | - Inflammatory, non-erosive, non-deforming arthritis  
<table>
<thead>
<tr>
<th></th>
<th>- Exclusion of other causes of inflammatory arthritis</th>
</tr>
</thead>
</table>
| Major criteria    | - Concurrent diagnosis of extra-articular tuberculosis  
|                   | - Complete response to antitubercular therapy |
| Minor criteria    | - Mantoux positivity  
|                   | - Associated hypersensitivity phenomenon, such as erythema nodosum, tuberculids or phlyctenular keratoconjunctivitis  
|                   | - Absence of sacroiliac and axial involvement |

**For diagnosis:**
- **Definite** – Essential + two major
- **Probable** – Essential + one major + three minor
- **Possible** – Essential + one major + two minor, or Essential+ three minor
