

A photograph showing a radon detector in the foreground, positioned in front of a doorway. The doorway is covered with a yellow tarp, and a white radon detector is visible on the tarp. The scene is dimly lit, with a warm, orange glow from the doorway.

Energy Efficiency and Radon: Recognizing Legal Liabilities

BC LUNG
FOUNDATION

Executive Summary

Radon occurs naturally when uranium breaks down in rock and soil. It is an invisible, odourless, and tasteless radioactive gas. When radon leaves the ground, it is usually diluted in air and is relatively harmless. However, radon can seep into indoor spaces (i.e., homes, which this guide focuses on) through small cracks and openings where the building contacts the soil. In some homes it can accumulate in higher concentrations, posing a health risk. When radon is breathed in, it can damage lung cells and cause lung cancer. Radon gas is the number one cause of lung cancer in non-smokers. In Canada alone, radon causes approximately 3,360 deaths each year.

There is now a large body of research that shows energy efficiency measures, whether in new homes or upgrades in older homes, can increase radon levels unless further steps are taken to test for and mitigate radon. A key part of energy efficiency measures in homes involve making the home more airtight, a process that can trap radon in the home and make it harder to escape. Even if efficiency upgrades include improving sealing the foundation and increasing mechanical ventilation, the overall effect can be to make radon worse.

This briefing note sets out our review of Canadian law as it applies to energy efficiency measures. Following basic principles of construction law, builders have a duty to ensure buildings are safe. Energy efficiency industry personnel, like others involved in building construction and renovation, have a duty of care to ensure they do not increase health risks. Courts can award damages for only the costs to remedy a defect that creates a danger and restore the building to a non-dangerous state--there is no need to show that a person has actually been harmed. We show how principles of negligence will apply to energy efficiency personnel whose advice and service provision make radon worse. We also suggest that energy efficiency upgrades fall under a class of processes and products for which there is a duty to warn. This is appropriate for products and processes which are both socially useful and can significantly impact on health or create health risks, and for which user information can make an important difference in health outcomes.

This note identifies distinct groups that may face legal risks (and so need to be attentive to radon), including builders, energy advisors, renovation contractors, and efficiency product manufacturers. We also examine government organizations that run efficiency programs and financial lenders, but find they are generally well shielded.

We make a number of conclusions for how energy efficiency personnel can take steps to follow the law and be protected from liability. This includes:

- clear warnings, consumer education and delivery of up to date materials to consumers about the risks of indoor contaminants, including radon, in retrofits,
- better education and certification standards for advisors and contractors (so they can communicate and take steps to avoid legal liabilities)
- informed consent from clients as to recognizing and accepting radon risks.
- warnings on energy efficiency products
- Including radon testing and mitigation as part of renovation work
- extending any subsidies, incentives, or loan programs for energy efficiency to include associated radon mitigation

Energy Efficiency and Radon: Recognizing Legal Liabilities

About our program. The BC Lung Foundation's Healthy Indoor Environments program is focused on providing education, resources, and policy options for addressing priority indoor air pollutants in British Columbia. Canadians spend 90% of their day indoors, with about 70% at home and 20% at work or school. The air we breathe indoors can contain particulates, gases, allergens, and fumes that can significantly affect our health in both the short and long term. Knowing the main indoor air pollutants, their sources, and how to reduce them are key to reducing harm to our health. Radon has been identified as the leading environmental carcinogen in Canada. For more information visit our website at <https://bclung.ca/programs-initiatives/healthy-indoor-environments-program>

1. Introduction: Energy Efficiency Measures Can Make Radon Worse

Radon occurs naturally when uranium breaks down in rock and soil. It is an invisible, odourless, and tasteless radioactive gas. When radon leaves the ground, it is usually diluted in air and is relatively harmless. However, radon can seep into indoor spaces (i.e., homes, which this guide focuses on) through small cracks and openings where the building contacts the soil. In some homes it can accumulate in higher concentrations, posing a health risk.

When radon is breathed in, it can damage lung cells and cause lung cancer. Radon gas is the number one cause of lung cancer in non-smokers. In Canada alone, radon causes approximately 3,360 deaths each year. Elevated radon has no side effects or warning signals until the person develops lung cancer.¹ It works synergistically with smoking. Health Canada estimates that non-smokers who are exposed to high levels of radon over a lifetime have a one in 20 chance of developing lung cancer. The risk increases significantly for smokers who are exposed to the same rate of radon over a lifetime, to a one in three chance.²

Health Canada has developed a national guideline for radon in indoor spaces to 200 becquerels per cubic metre (200 Bq/m³). Any level above 200 Bq/m³ constitutes elevated radon.³ Health Canada recommends all homes be tested, and if elevated levels are found, the problem can be easily remedied. There are professional mitigators certified by the Canadian National Radon Proficiency Program, who can evaluate homes and install radon systems in one to two days, for less than the cost of replacing a furnace.

There is now a large body of research that shows energy efficiency measures, whether in new homes or upgrades in older homes, can increase radon levels unless further steps are taken to test for and mitigate radon.⁴ We summarize the research and explain the process in a companion report *Energy Efficiency and Radon: Making the Connection*. A key part of energy efficiency measures in homes involve making the home more airtight, a process that can trap radon in the home and make it harder to escape. Even if efficiency upgrades include improving sealing the foundation and increasing mechanical ventilation, the overall effect can be to make radon worse.

In what follows, we spell out how this creates legal liabilities for efficiency product manufacturers (such as producers of efficient windows and doors), energy advisors, contractors, and others. There is a clear need to ensure homeowners understand radon risks, and for the energy efficiency industry to ensure it does no harm.

2. Law on Duty of Care

Negligence law gives rise to many duties in Canada, such as the need to be careful when driving a motor vehicle to professionals being careful in giving advice. In a successful negligence action, the person who sues (the plaintiff) must demonstrate that (1) the other party (the defendant) owed him or her a duty of care, (2) the defendant's behaviour breached the required standard of care; (3) the plaintiff sustained damage, and (4) the damage was caused, in fact and in law, by the defendant's breach.⁵

Courts have clearly found that persons responsible for the design and construction of a building have a duty of care to ensure the building does not contain defects that pose foreseeable and substantial danger to the health and safety of the occupants.⁶ Courts have also extended this to renovation work,⁷ and to building contractors.⁸ The duty is owed not only to those with a direct contractual relationship (such as the purchaser of a home) but subsequent owners.⁹ With regards to buildings, courts can award damages for only the costs to remedy a defect that creates a danger and restore the building to a non-dangerous state--there is no need to show that a person has actually been harmed.¹⁰ Exclusions in a contract will not limit tortious liability for negligent construction.¹¹

3. Duty to Warn

Courts recognize that some products and processes are useful and legitimate even when they carry some dangers. In these cases, the issue will not be so much negligent design, manufacture or marketing, but whether the appropriate standard of care has been satisfied through appropriate warnings.

We see the need for warnings in products liability cases such as for industrial machines for processing polyester¹² wood sealants¹³, breast implants,¹⁴ or anti-smoking drugs with adverse mental health side effects.¹⁵ Product liability cases also include products incorporated into buildings—allowing that damages can be recovered to make the building safe before anyone is hurt.¹⁶ The courts assess whether the product has a propensity to injure, whether the manufacturer knew or should have known of the danger, the reasonableness of the warning and whether the lack of sufficient warning contributed to the damage.¹⁷ The duty to warn is a continuing duty, requiring manufacturers to warn not only of dangers known at the time of sale, but also of dangers discovered after the product has been sold and delivered. All warnings must be reasonably communicated, and must clearly describe any specific dangers that arise from the ordinary use of the product.¹⁸ The courts have found that general warnings can be insufficient: “Where significant dangers are entailed by the ordinary use of the product, it will rarely be sufficient for manufacturers to give general warnings concerning those dangers; the warnings must be sufficiently detailed to give the consumer a full indication of each of the specific dangers arising from the use of the product”¹⁹ The plaintiffs must show that the warning would have altered their behaviour.²⁰

Canadian courts have made clear that this stems from basic principles of duty of care and negligence law: “When manufacturers place products into the flow of commerce, they create a relationship of reliance with consumers, who have far less knowledge than the manufacturers concerning the dangers inherent in the use of the products and are therefore put at risk if the product is not safe. The duty to warn serves to correct the knowledge imbalance between manufacturers and consumers by alerting consumers to any dangers and allowing them to make informed decisions concerning the safe use of the product”.²¹

Energy Efficiency and Radon: Recognizing Legal Liabilities

Warnings are also common in occupier liability cases. There is a duty to warn if spaces have dangers—hence the warning signs for wet floors.²² Most provinces have Occupier Liability statutes, but common principles of negligence continue to apply.²³ No warning is required for risks associated with activities of everyday life.²⁴ A failure to warn of unsafe conditions amounts to a breach of a requisite standard of care, e.g. the creation of an objectively unreasonable risk of harm.²⁵ Courts have also found that a warning sign can also be relevant concerning causation—they can make a difference as to whether a person might have acted differently and avoided harm.²⁶

The duty to warn also extends to professional advice and guidance. In medical cases, patients are to be notified as to any dangers to ensure they understand and agree to risks. It is the duty of the physician to give a fair and reasonable explanation of the proposed treatment including the probable effect and any special or unusual risks.²⁷ The courts treat failure to give the requisite information for consent as a negligence issue.²⁸ For lawyers, the standard of a reasonably competent solicitor includes exercising reasonable care to warn a client about the legal consequences and risks of a course of action. For instance, negligence has been found against lawyers who: Failed to tell a purchaser of land that it was too small to receive a new building permit;²⁹ failed to explain to a client the risks of a real estate transaction which could have been structured differently;³⁰ failed to advise an executor of a will about the need to obtain court approval when purchasing an asset from the estate,³¹ or failed to state that it would be necessary to incur additional costs to clear a conveyance transecting a property.³²

Informed consent as to risks of procedures is an important part of the duties of doctors.³³ It is also standard practice in university research settings, where researchers must obtain informed consent prior to conducting any type of research on humans.³⁴ Canadian courts have recognized a close connection between the duty to warn and principles of informed consent. If a person has the

Energy Efficiency and Radon: Recognizing Legal Liabilities

right to decide what should be done to them, they also have the right to know what risks are involved and to make meaningful decisions based on a full understanding of those risks. True consent to what happens to one's self is the informed exercise of a choice, and that entails an opportunity to evaluate knowledgeably the options available and the risks attendant upon each. Informed consent operates to address inequality of information found in doctor-patient or medical product manufacturer-consumer relations.³⁵

The need for warning has also been recognized in Canadian federal regulations under the *Canada Consumer Product Safety Act*, S.C. 2010, c. 21 and the *Food and Drugs Act*, R.S.C. 1985, c. F-27. These do not replace common law duties, but offer a regulatory framework for enforcement and redress. Regulations provide detailed provisions about instructions for use and potential dangers in use for—just to mention those whose regulation starts with the letter ‘c’-- carbonated beverages sold in glass containers,³⁶ carriages and strollers,³⁷ charcoal for cooking³⁸ labelling for children’s sleep wear if contains flame retardant³⁹ consumer chemical containers⁴⁰ corded window coverings⁴¹ and cribs, cradles and bassinets.⁴²

4. Negligence for Elevated Radon

Courts have not yet found specific duties with regards to radon. However, care to ensure radon risks are minimized fits squarely within health and safety concerns in construction, contracting, and product safety. We think it is only a matter of time before courts find a duty of care is at play.

There is ample literature which makes clear that high radon is not safe, including:

- A large body of recognized research, consolidated into guidance from organizations such as the International Commission on Radiological Protection (ICRP) ⁴³ and the United Nations Scientific Committee on the Effects of Atomic Radiation (UNSCEAR).⁴⁴
- Guidelines and extensive advice from Health Canada, including that every home should be tested.⁴⁵
- There are radon provisions in the National Building Code and provincial building codes⁴⁶
- There is growing acceptance that in the sale and purchase of homes, elevated radon constitutes a material latent defect. This includes court decisions from Quebec,⁴⁷ and guidance from the Real Estate Council of Alberta⁴⁸ and from the British Columbia Financial Services Authority. ⁴⁹
- Ontario's home warranty plan provider, Tarion, recognized and will compensate *new* home buyers who find high radon levels (e.g. above 200 bq/m³) considering it to potentially be a Major Structural Defect.⁵⁰ This applies even though most of Ontario does not have radon

⁴³ International Commission on Radiological Protection, (ICRP) 1993. Publication 65: Protection against radon-222 at home and at work, Annals of the ICRP 23: 1-45. ICRP, 2010. Energy Efficiency and Radon: Recognizing Legal Liabilities

provisions in the Build Code. By 2018, 48 cases were processed with an average payout of 3,200 dollars.⁵¹

- For rental properties, tribunals in Ontario and Quebec have found that elevated radon is unacceptable.⁵²
- Some provinces workplace regulation includes specific policies that cover radon.⁵³

There is a close connection between energy advising, retrofitting, energy efficiency products (such as efficiency-rated windows and doors) and elevated radon. The courts have already clearly outlined that contractors and building designers have a duty to ensure buildings do not pose a danger to health and safety. However, we can reiterate how the link between energy efficiency efforts and radon creates a duty of care that can be breached.

Foreseeability. Claims in negligence require that harm is a reasonably foreseeable consequence of the conduct in question. Clearly, advising homeowners to install or actually installing energy efficiency measures such as efficient windows and doors can lead to elevated radon levels. Courts will consider whether an overt act of the defendant has directly caused foreseeable physical harm to the plaintiff.⁵⁴ It is well established in Canadian law that it is reasonably foreseeable to contractors that negligent design or construction of buildings leading to latent defects can lead to personal injury or damage to property.⁵⁵

Proximity. Courts consider whether there is a ‘proximity’ to clients. In the context of negligence law, proximity means there is a type of relationship in which a duty of care to guard against foreseeable harm may rightly be imposed, e.g. the relationship between the plaintiff and the defendant is of such a nature that the defendant may be said to be under an obligation to be mindful of the plaintiff’s legitimate interests.⁵⁶ This may be engaged where the defendant is engaged in a commercial enterprise and offer services to the public, and have associated responsibilities to not thereby cause harm.⁵⁷ Homeowners hire energy advisors and contractors to instruct them on the benefits and risks of, or to implement energy efficiency measures.

Policy reasons. The courts will also look to whether there exist any residual policy considerations that ought to negative or reduce the scope of the duty, given the effect this might have on other legal obligations, the legal system and society more generally. While duties to bring attention to radon and other indoor quality concerns complexifies the job of advisors and contractors, it does not unreasonably do so, and health and safety warnings are common. Moreover, there are strong policy reasons to recognize a duty of care of energy efficiency advisors, contractors and product

Energy Efficiency and Radon: Recognizing Legal Liabilities

suppliers around radon. Radon is the second leading cause of lung cancer in Canada, after smoking, killing over 3000 Canadians a year. Energy advisors and contractors are now a key entry point where building professionals have contact with homeowners. Advising on radon offers an important way to spread the word and help ensure the building stock is made safe into the future.

Level of danger. Courts consider whether there is a real and substantial danger. They will look for instance, as to whether a building is not in compliance with the Building Code in effect at the time it was built.⁵⁸ However, compliance with the Building Code is not determinative, the test is whether there is increased risk of harm beyond that considered reasonable in the community.⁵⁹ Actions have been successful where there were: Malfunctional smoke alarms;⁶⁰ unstable load-bearing walls and moisture creating mould;⁶¹ a pipe which allowed natural gas to escape, leading to an explosion;⁶² condensation that over time caused rotting in tresses and beams which supported the building structure;⁶³ a roof in danger of collapsing due to missing welds;⁶⁴ structural defects in grain bins which could lead them to fail if at full capacity;⁶⁵ elevator with defective breaks;⁶⁶ and a house not built to properly withstand seismic activity⁶⁷. One defining feature is if there is evidence of harm to health. As such, an HVAC system that left a dry throat and mouth and nose irritation only was not seen as a sign of negligence.⁶⁸

Causation. It is likely that many current lung cancer patients are not making the link to past exposure to radon. Indeed, there will need to be evidence that a contractor, advisor, manufacturer or builder failed in their standard of care, giving rise to elevated radon, which in turn was likely to have caused the cancer. That said, plaintiffs will not need to show that a negligent advisor, contractor, builder is the only cause of the problem. Principles of contributory negligence allow that damage awards can be divided between multiple defendants each of which is apportioned a share of responsibility.⁶⁹ As well, a plaintiff does not need to show that the defendant was the only cause of the problem. Damages can be awarded against a person who “materially contributed” to the occurrence of injury in the sense of contributing to the risk that the injury would occur.⁷⁰

5. Duties and Standards of Care for Diverse Actors

Often, the question before the courts will not be whether there is a duty, but rather whether the requisite standard of care has been met. Some professionals, such as doctors and lawyers, may be held to a higher standard than trades people. The courts thus look to the particular circumstances of the case. Unfortunately, the fact remains that there is a lack of clear guidance and education on radon for energy advisors and contractors. Within the construction trades and energy advising communities, radon remains poorly understood. Moreover, retrofit contractors often do not have specialized qualifications. Nonetheless, there remain good grounds for the claim that the appropriate standard of care includes providing warnings about radon, advising on steps that can be taken to address it, and mitigating radon if necessary.

Builders and Contractors (including retrofits). BC Lung has already considered the potential liabilities of builders, architects, engineers involved in the construction of new homes with high radon, in *Radon: Rights and Liabilities in Construction Law*.⁷¹ There are duties in negligence law and tort when there is elevated radon. In most cases this is likely to be handled through New Home Warranty. General principles of negligence in construction law will also apply to building retrofits. The applicable standard is that of a reasonable and prudent person who undertakes the construction of a house, equal to the standard of care expected from a reasonably competent contractor.⁷² The standard of care is typically deemed to be met where a contractor hires qualified building professionals to design and supervise the construction.⁷³ Some indication that radon should be within builders and contractors understanding can be found from:

- Most provinces' building codes describe radon as a problem and also require 'rough-ins'—the beginnings of radon systems that can be completed once a home is occupied and radon testing been performed. While the courts impose an objective standard, they can also look to Building Codes as guidance of the standard of care.⁷⁴
- Clear guidance from Health Canada on the need to test after occupancy, and that: "Homeowners should always consider re-testing whenever major renovations are performed that might substantially change the ventilation or airflow in the home or the use of the rooms in the lowest-occupied level. If substantial changes are made, a 3-month test should be performed during the first heating season after completion of the renovations"⁷⁵

Energy Efficiency and Radon: Recognizing Legal Liabilities

- Natural Resources Canada already has information on its webpages on energy retrofiting that people should be aware of indoor air quality concerns, including radon.⁷⁶
- Newspaper articles reporting scientific studies on radon and energy efficiency, in national papers such as the Globe and Mail⁷⁷
- Advocacy campaigns by Canadian health non-profit organizations, environmental organizations and academic researchers on the links between energy efficiency and radon⁷⁸
- Guidance from the US Environmental Protection Agency (EPA), Department of Energy (DOE) and National Renewable Energy Laboratory (NREL).⁷⁹ These organizations have produced Guidelines for the energy efficiency industry (and, for DOE, conditions on loans) that spell out the links between radon and efficiency and provided detailed instructions for securing consent and/or removing radon risks.

Energy Advisors. Here, there remains something of a grey area in that there is a lack of clear guidance and education on radon for energy advisors and energy advisors are not regularly seen as special professional group. Generally, a professional needs to meet the standard of care appropriate to members of the profession they have undertaken.⁸⁰ It is unlikely courts would attach the same standards to energy advisors as they would lawyers or doctors—given the absence of professional associations or self-governance of the profession. However, it is reasonable to expect energy advisors to give a full range of advice around energy retrofits. In particular, if they are advising homeowners to conduct retrofits, they should also warn clients of potential risks. Natural Resources Canada appears to already recognize this issue. NRCan specifically mentions radon in materials earmarked for its certified energy advisors. For instance the website “How to become an NRCan-registered energy advisor” discusses “Foundation Level Exam Resources” and notes it is up to the candidate to research available training resources, and gives

Energy Efficiency and Radon: Recognizing Legal Liabilities

links to Health Canada's radon information.⁸¹ In “Keeping the Heat In” Natural Resources Canada's Office of Energy Efficiency offers a guide to educate on basic principles of building science and to provide guidance in home retrofit projects such as insulation and air sealing improvements. This specifically mentions radon.⁸²

Efficiency Equipment Producers. There is clear evidence that many energy efficient products directly contribute to reducing airflow within a building—indeed that is their purpose. Scientific research indicates that energy efficient windows and doors can lead to higher radon levels. Likewise, ventilation systems, if not properly balanced, can depressurize the home, drawing more radon in. Like drugs which can be of significant benefit, but which may have side-effects, there is a duty to provide a warning to consumers.

Energy Efficiency Organizations. Many organizations now support energy efficiency in Canada, such as Natural Resources Canada or provincial organizations such as CleanBC. There is some evidence they are not paying sufficient attention to radon, either in materials or in its education of certified energy advisors. There are some cases where courts have ruled that government agencies have a private duty and wronged parties can sue.⁸³ However, courts are exceedingly reluctant to grant a duty of care to public organizations in virtue of oversight role over programs. Generally, government actors are not liable in negligence for policy decisions, but only operational decisions. The basis of this immunity is that policy is the prerogative of the elected Legislature—it is inappropriate for courts to impose liability for the consequences of a particular policy decision.

As well, showing a new duty requires showing a close and direct relationship (“proximity”) that makes it just to impose a duty of care. This requires not only that any harm is foreseeable, but that there are particular circumstances of the relationship. For public organizations, such duties will be established by the governing statute. However, most statutes are not worded in ways that create such duties. Further, the courts will also consider policy reasons for not extending the duty of care such as the need to give freedom to a regulator to balance public and private rights and the potential costs to the public purse of opening up possibilities for litigation.⁸⁴ There are many cases where plaintiffs have tried to sue public bodies and failed, such as against BC's Registrar of Mortgage Brokers, for failing to suspend a wayward broker⁸⁵ against local governments for approving a subdivision that later proved to be liable to landslides and sinkholes⁸⁶, against Canada Mortgage and Housing Corporation for insuring a mortgage,⁸⁷ or researching leaky condos without

Energy Efficiency and Radon: Recognizing Legal Liabilities

informing specific condo owners⁸⁸ against a city for delay in issuing a building permit⁸⁹, against government regulators for approving medical devices,⁹⁰ or against a College of Physicians and Surgeons for failing to regulate a doctor who prescribe opioid drugs.⁹¹ These cases suggest it is highly unlikely that actions against government agencies would be successful.

Financial Lenders. Many organizations lend funds to facilitate home renovations and retrofits, such as credit unions and local governments. It is generally very difficult to assign liability to such entities in virtue of the acts and omissions of the projects they fund. In the absence of "exceptional circumstances" or a "special relationship" the relationship between a financial institution lender and a customer borrower is, generally, a "purely commercial relationship of creditor and debtor" and does not give rise to any duty of care.⁹² The assumption is that each party is looking out for its own best interests and is entitled, within reason, to infer that the other party is doing the same.⁹³ Only rarely will there be a special relationship where someone who seeks a loan from a lender will be relying on the lender for advice concerning retrofits.

6. Conclusion: Ways to Follow the Law and Reduce Legal Risks

a. Warnings and Consumer Education

There is a clear need for consumers to be educated on radon and warned as to the risks involved in energy retrofits. In a companion report, *Energy Efficiency and Radon: Gaps In the System* we discuss the structure of energy advising and contracting in Canada, the role of Natural Resources Canada and other support and funding agencies, and the education and certification of energy advisors and contractors and available guidance on energy retrofits and renovations. As that report discusses, this system needs to be modified to ensure all participants fulfill the duty to warn: This means the system be designed to make sure consumers understand risks, and how to minimize them. This includes the following.

- Clear inclusion of information on the health and science of radon (and other indoor air quality) issues and how energy efficiency exacerbates the problem in energy efficient guides and educational materials.⁹⁴
- Changes to education and/or certification of advisor and contractors.
- Clear explanations and delivery of information on radon and other indoor air quality issues by energy advisors and contractors to clients. In the United States, the EPA has produced

Energy Efficiency and Radon: Recognizing Legal Liabilities

Energy Savings Plus Health: Indoor Air Quality Guidelines, 2021 which both includes detailed analysis of radon and its links to efficiency upgrades and instructions for the efficiency industry to ensure clients are educated on the problem. Similar guidance is provided in the *National Renewable Energy Laboratory's Standard Work Specification Tool*, 2017.⁹⁵

- Energy efficiency products include warnings concerning adverse risks concerning indoor air quality and radon.

We also think extending any subsidies, incentives, or loan programs for energy efficiency to include associated radon mitigation is a way of making clear to consumers that there is a problem

For product producers, a motivation may be the substantial risks of litigation, including through class actions based on the duty to warn. However, we think there is a clear role for the federal government to create new regulations under the *Consumer Product Safety Act*.

The duty to warn is an ongoing duty. This means there is a need for product manufacturers, advisors, and contractors to now contact former clients and consumers as to the risks of radon from energy upgrades.

b. Informed Consent

Energy advisors and contractors are engaged in procedures that create known health risks. An important way for them to protect themselves, to make sure clients are aware of radon, is to secure informed consent through having clients sign appropriate forms. This technique is common in the medical field (such as before a procedure with established risks) as well as in scientific research involving humans.

In the United States, the DOE's Weatherization Assistance Program provides financial assistance for low-income households. Its *Weatherization Health & Safety Guidance, WPN 17-7*, requires clients to sign an informed consent form that addresses radon risks prior to receiving services.⁹⁶ A model consent form is provided.⁹⁷

c. Testing and Mitigation

Ultimately, for those who advise and conduct energy upgrades, 'not contributing to harm' means ensuring that homes are tested and, if necessary, mitigated.

In Canada's current system, homeowners typically act as the supervisors of the retrofit process, working with advice from energy advisors but hiring diverse contractors to get the job done.⁹⁸ This creates a space of shared responsibility where its easy for any one actor to put the onus on others to ensure radon is tested and if, necessary, mitigated. While it is tempting to put the

⁹⁵ NREL, 2017. Standard Work Specifications for Home Energy Upgrades. Ibid, see sec. 2.0501.1. Note, this incorporates older EPA guidance-- EPA's Healthy Indoor Environment Protocols for Home Energy Upgrades, 2014—and is in the process of being updated.

Energy Efficiency and Radon: Recognizing Legal Liabilities

onus on the homeowner, they are at a significant informational disadvantage compared to others in the system. As well, courts have developed principles of contributory negligence precisely to avoid no one agent being held responsible in cases of unstructured collectives. There is a clear need for the collective of persons who are responsible for energy efficiency measures to ensure homes are tested and mitigated for radon.

The simplest way to make this happen is to see radon testing and mitigation as essential components of the building and energy upgrade process. For energy advisors this means advising on radon testing and mitigation, for builders and contractors it means making sure this work gets done, and for incentives, subsidies and loan programs, it means ensuring radon work is covered in those programs.

In the US, EPA takes the position that energy efficiency contractors should test for radon before and after upgrades. If after upgrades radon levels have increased, or if levels are above EPA's radon action level, contractors should do the mitigation work.⁹⁹ This however, rests on the American convention of short term (48 hour) radon tests, which are widely criticized as substituting convenience for accuracy given how radon levels fluctuate¹⁰⁰ and rejected by Health Canada.¹⁰¹ Health Canada's recommended three-month test creates complications for contractors oversight. Contractors should do what they can to ensure radon testing and mitigation. Where contractors have significant control and oversight over the complete project, this should include placing testing devices, and subsequent visits for mitigation. Where they are doing partial work or rely on the homeowner's oversight, this can include an informed consent process, leaving low-cost radon detectors and instructions with clients, follow up reminders (such as phone calls), and helping to connect clients with radon mitigators.
